Flavor Help

Language	RegEx101 Support	Comments
JavaScript	**Full**	Uses your browsers native implementation
PHP	**Full**	Recent versions of PHP use PCRE2.
Perl	*Partial*	Use the PCRE2 flavor for the greatest support
Python	**Full**	Uses Python 3.14
Ruby	*Partial*	Oniguruma and Onigmo are quite similar to PCRE in their feature set
Java	**Full**	Newer versions of Java have greater support for variable width lookbehinds
C++	**Full**	Use the JavaScript flavor
Golang	**Full**	Uses googles RE2 engine
.NET	**Full**	Uses .NET 7

re2-utf8-strings.py > test_string

Vercel
@vercel

We paid $1 million to hackers to harden our firewall defenses.

Today we're telling the story of how we strengthened our WAF, disclosing a runtime mitigation layer for the first time, and how we partnered with @Hacker0x01 to defend against React2Shell.

Cookie Chaos: How to bypass __Host and __Secure cookie prefixes

Zakhar Fedotkin
Researcher
@zakfedotkin

Published: Wednesday, 3 September 2025 at 14:46 UTC

Updated: Wednesday, 3 September 2025 at 14:46 UTC

Cookie Prefixes: __Host-

The `__Host-` prefix adds stricter requirements: the `Secure` attribute, no `Domain` attribute, and `Path` set to `/`. This binds the cookie to the exact origin hostname, preventing subdomain interference.

```
Set-Cookie: __Host-ID=abc; Secure; Path=/
```

Information Classification: General

Cookie Chaos Flow

Modern .Net Whitespace Processing

Char.IsWhiteSpace Method

Definition

Namespace: System

Assemblies: netstandard.dll, System.Runtime.dll

Indicates whether a Unicode character is categorized as white space.

Overloads

Expand table

Name	Description
IsWhiteSpace(Char)	Indicates whether the specified Unicode character is categorized as white space.
IsWhiteSpace(String, Int32)	Indicates whether the character at the specified position in a specified string is categorized as white space.

Information Classification: General

Modern .Net Whitespace Processing

Remarks

White space characters are the following Unicode characters:

- Members of the UnicodeCategory.SpaceSeparator category, which includes the characters SPACE (U+0020), NO-BREAK SPACE (U+00A0), OGHAM SPACE MARK (U+1680), EN QUAD (U+2000), EM QUAD (U+2001), EN SPACE (U+2002), EM SPACE (U+2003), THREE-PER-EM SPACE (U+2004), FOUR-PER-EM SPACE (U+2005), SIX-PER-EM SPACE (U+2006), FIGURE SPACE (U+2007), PUNCTUATION SPACE (U+2008), THIN SPACE (U+2009), HAIR SPACE (U+200A), NARROW NO-BREAK SPACE (U+202F), MEDIUM MATHEMATICAL SPACE (U+205F), and IDEOGRAPHIC SPACE (U+3000).

Information Classification: General

Whitespace Processing

Trim()

Source: String.Manipulation.cs

Removes all leading and trailing white-space characters from the current string.

slonser
@slonser_

Many of you have seen that article - the technique is awesome, but there's a small nuance. The idea that "MySQL casts the odd 'a' to normal 'a'" is a bit simplified: MySQL uses the Unicode Collation Algorithm and compares chars by weights.
